Optimal crop nutrition is crucial for achieving high yields.

Nitrogen fertilization is fundamental for achieving the desired yield on one hand, and on the other, it represents one of the largest items in the expense structure. If we can reduce the amount of nitrogen applied per decare without affecting the obtained yield, we could improve the final financial result. This would primarily be reflected in lower fertilizer costs, but also in the possibility for additional funding under Eco-schemes for preserving and restoring soil potential.

VIXERAN is an excellent choice from Syngenta's portfolio, which can be successfully integrated into your nitrogen fertilization plan.

VIXERAN delivers nitrogen to crops in a natural and sustainable way.

VIXERAN helps crops use the nitrogen available in the soil or additionally applied much more efficiently, and on the other hand, has the potential to fix nitrogen from the atmosphere, providing it to the crops.

Numerous trials and studies in field crops clearly show that **VIXERAN** allows for a reduction in the fertilizer rate by up to 30-40 kg/ha in active substance, compensating for the nitrogen required by the crop and preserving the yield potential.
